Nigeria

PROFILE

Cybersecurity undergraduate building practical security tools in Python, with a long-term focus on post-quantum cryptography. I spot problems early and build working solutions: log analysis that flags threats before they escalate, and hands-on experiments that make quantum-safe migration concrete.

EDUCATION

B.Tech. Cybersecurity — Federal University of Technology Akure (FUTA) In progress
200 Level. Coursework and hands-on practice across security fundamentals, system hardening and log review.

SELECTED PROJECTS

Kyber Bridge — Post-quantum key exchange prototype Python · FastAPI · PQC · 2026

- Python prototype exploring post-quantum KEM migration for a small API gateway, with a swappable key-exchange layer comparing classical and post-quantum handshakes side by side.
- Measured handshake timing and payload sizes; documented each trade-off in plain language.

Threat Lens — Log anomaly detection Python · Pandas · SQL · 2026

- Log-analysis tool that builds a baseline of normal server activity with Pandas, scores each time window against it and attaches a plain-language explanation to every alert.
- Focused on interpretability: alerts explain why activity is unusual, not just that it is.

Lattice Notes — Cryptography study notebook Python · NumPy · 2026

- Interactive NumPy notebook that generates small lattices and visualises how the shortest-vector problem hardens as dimensions grow, making post-quantum specs readable.

SKILLS

Core	Python, backend development (FastAPI, REST), SQL & data modelling
Developing	Data analysis (Pandas, NumPy), machine-learning fundamentals applied to security data
Direction	Post-quantum cryptography, lattice-based schemes, mathematical foundations

FOCUS

Preparing for a career in quantum-safe engineering: reading PQC specifications, running small experiments, and writing about what I learn in public.
